Meeting 2 - Application Structure

In this meeting we talked about the different pages of the application. The following are the pages we plan to include in the project:

- Landing page
- About
- Login/Signup
- Homepage
- Advanced Search
- Account management
- Connections page
- Apartment page - maybe

More information on each page below.

Landing Page

A static page that will include:

- Short description about the application
- Image/Short video
- Signup and login form

About

A static page that will include:

- Text about the application with images.

Homepage

A user-specific page - will be available only for signed in users. It will include the following:

- A list of apartment/roommate cards
- User sidebar containing basic info about the user

Advanced Search

A dynamic page, but not a user-specific page that will be available only for signed in users. It will include the ability to search through all the apartments in the system (unlike the apartments shown in the homepage which are ajdusted for the user's profile).

This is the least important page in our application, as it is an extra feature.

Account

The user will be able to change his information - all the information such as:

- Basic information
- Roommate preferences
- Apartment preferences (city, price, num of roommates etc.)

Connections

The user will be able to manage and view his 'matched' apartments.

May be a chat if we can do it.

The user will be able to remove/pin his connections.
